No. Matric : A23CS0201

Subject : Data Structure and Algorithm (section 02)

Group : 5

REFLECTION

The first thing we did is conduct the discussion and split the task equally among us. We had to write C++ code for Bubble Sort, Improved bubble sort, Insertion Sort, and Selection Sort in order to evaluate how well they performed by counting the number of comparisons and swaps. I was able to have a deeper understanding of this specific algorithm because my task was constructing the Selection Sort. After I finished doing my part, we compile it into one document and we checked each other works also, so that we could have an equal understanding regarding to this project. This project also has help me a lot in understanding more about how the simple sorting works.
